

Yes. I reviewed the **actual HTML page you uploaded**, including its JavaScript validation and premium-calculation logic. The use case document should therefore reflect the **exact rules implemented in this page**, rather than generic insurance rules.

For example, the page implements:

- Full name: **3–50 characters, letters and spaces only.** insurance_sandbox
- Age: **18–65 years** calculated from DOB. insurance_sandbox
- Sum assured: **₹5,00,000–₹50,00,00,000.** insurance_sandbox
- Policy terms: **10, 15, 20 or 30 years.** insurance_sandbox
- Maximum **2 riders.** insurance_sandbox
- KYC attachment is mandatory. insurance_sandbox
- T&C acceptance is mandatory. insurance_sandbox
- The actual premium formula is explicitly implemented in the page's JavaScript. insurance_sandbox

The calculation is:

Non-smoker

- Age ≤ 40: $\text{Premium} = \text{Sum Assured} \times 0.0012 + (\text{Riders} \times ₹1,200)$
- Age > 40: $\text{Premium} = \text{Sum Assured} \times 0.0020 + (\text{Riders} \times ₹1,200)$

Smoker

- Age ≤ 40: $\text{Premium} = \text{Sum Assured} \times 0.0025 + (\text{Riders} \times ₹1,200)$
- Age > 40: $\text{Premium} = \text{Sum Assured} \times 0.0033 + (\text{Riders} \times ₹1,200)$

The page rounds the final premium to the nearest rupee before displaying it.

insurance_sandbox

I can create a **proper QA Use Case / Requirements document PDF** from this HTML with columns such as:

Use Case	Field	Validation Rule	Positive Test	Negative Test	Expected Error	Calculation Impact
UC-01	Full Name	3–50 letters/spaces	Rahul Sharma	R@hul123	Invalid name	None
UC-02	DOB	Age 18–65	Age 35	Age 17	Age validation	Base rate
UC-03	Smoking	Mandatory selection	Smoker	Blank	Tobacco status required	Base rate
UC-04	Sum Assured	₹5L–₹50Cr	₹10L	₹4L	Range validation	Premium

Use Case	Field	Validation Rule	Positive Test	Negative Test	Expected Error	Calculation Impact
UC-05	Policy Term	10/15/20/30	20 years	25 years	Coverage duration	No direct impact
UC-06	Riders	Maximum 2	2 riders	3 riders	Rider limit	+₹1,200
UC-07	KYC	File mandatory	PDF/JPG/PNG	No file	KYC required	Calculation blocked
UC-08	T&C	Must be checked	Checked	Unchecked	Declaration required	Calculation blocked

And, importantly, I'll include **calculation test cases with actual expected premium values**, not just generic "verify premium."

For example, with **age 35, non-smoker, ₹10,00,000 sum assured and 2 riders**:

$$\text{₹}10,00,000 \times 0.0012 + (2 \times \text{₹}1,200) = \text{₹}3,600$$

I'll also include boundary tests such as **age 18/65, age 17/66, ₹5,00,000/₹50,00,00,000, 0/1/2/3 riders**, plus combinations of smoker/non-smoker and age above/below 40.
