

Absolutely. For an **insurance testing project**, a risk-based approach is especially useful because not all functions have the same business impact. A premium calculation error or incorrect policy issuance is much more critical than, for example, a cosmetic UI issue.

Below is a practical set you can use for **ISTQB-style testing, manual testing, and Playwright automation**.

1. Insurance application — major functional areas

A typical insurance application can be divided into:

1. Customer registration
2. Customer/profile management
3. Insurance quote
4. Risk assessment
5. Premium calculation
6. Policy creation/issuance
7. Policy modification/endorsement
8. Policy renewal
9. Policy cancellation
10. Payment
11. Claims
12. Claim settlement
13. Document generation
14. Notifications
15. Search/reporting
16. Authentication and authorization

For automation practice, I'd concentrate initially on **Quote → Risk → Premium → Policy → Payment**, because these give you good examples of forms, validations, calculations, conditional fields, and business rules.

2. Risk-based testing model

I would classify scenarios approximately like this:

Priority	Risk	Examples
P1 – Critical	Financial/legal/customer impact	Premium calculation, policy issuance, payment, claim settlement
P2 – High	Major business functionality	Quote generation, risk validation, renewal, cancellation

Priority	Risk	Examples
P3 – Medium	Important but workaround exists	Customer profile, search, documents
P4 – Low	Limited business impact	UI formatting, cosmetic issues

A useful risk score is:

Risk = Probability × Impact

For example:

Function	Probability	Impact	Risk
Premium calculation	5	5	25 – Critical
Payment	4	5	20 – Critical
Policy issuance	4	5	20 – Critical
Claims	4	5	20 – Critical
Quote generation	4	4	16 – High
Renewal	3	4	12 – High
Customer profile	3	3	9 – Medium
UI formatting	2	1	2 – Low

3. Key test scenarios and test cases

A. Customer registration

P1/P2 scenarios

TC ID	Scenario	Expected Result	Priority
REG-001	Register with valid customer details	Customer successfully registered	P2

TC ID	Scenario	Expected Result	Priority
REG-002	Mandatory fields left blank	Appropriate validation displayed	P2
REG-003	Invalid email format	Registration rejected	P2
REG-004	Invalid phone number	Validation displayed	P2
REG-005	Duplicate customer/email	Duplicate registration prevented	P2
REG-006	Invalid date of birth	Registration rejected	P2
REG-007	Customer below minimum age	Appropriate business validation	P1
REG-008	Maximum field lengths	Input handled correctly	P3
REG-009	Special characters in name/address	Correct validation/handling	P3

4. Insurance quote

This is one of the most important areas.

TC ID	Scenario	Expected Result	Priority
QUO-001	Generate quote with valid information	Quote generated	P1
QUO-002	Missing mandatory information	Quote not generated	P1
QUO-003	Invalid vehicle/property/customer information	Validation displayed	P1
QUO-004	Minimum allowable age	Quote generated/rejected according to rule	P1
QUO-005	Maximum allowable age	Correct business rule applied	P1

TC ID	Scenario	Expected Result	Priority
QUO-006	High-risk customer	Correct risk classification	P1
QUO-007	Low-risk customer	Correct risk classification	P1
QUO-008	Change coverage	Premium recalculated	P1
QUO-009	Add optional coverage	Premium increases correctly	P1
QUO-010	Remove optional coverage	Premium decreases correctly	P1
QUO-011	Quote expiry	Expired quote cannot be used	P2
QUO-012	Generate multiple quotes	Each quote has unique reference	P2

5. Risk assessment

Risk assessment should receive **very high priority** because it directly affects premium and underwriting decisions.

For example:

```
Age
Driving history
Claims history
Vehicle type
Vehicle value
Location
Coverage
Deductible
Previous insurance
```

Test cases:

TC ID	Scenario	Expected Result	Priority
RSK-001	Low-risk customer	Low-risk classification	P1
RSK-002	High-risk customer	High-risk classification	P1

TC ID	Scenario	Expected Result	Priority
RSK-003	Multiple previous claims	Risk increases correctly	P1
RSK-004	No previous claims	Correct discount/risk applied	P1
RSK-005	High-value vehicle	Correct risk factor applied	P1
RSK-006	High-risk location	Correct risk factor applied	P1
RSK-007	Invalid risk information	Quote prevented/rejected	P1
RSK-008	Boundary age	Correct risk band selected	P1

6. Premium calculation

This should be **your highest automation priority**.

Suppose the business rule is:

Base Premium = \$1,000

Risk surcharge:

Low risk = 0%

Medium risk = 20%

High risk = 50%

Optional coverage = \$200

Discount:

No claims = 10%

You would test:

TC ID	Scenario	Expected
PRE-001	Base premium only	\$1,000
PRE-002	Low risk	\$1,000

TC ID	Scenario	Expected
PRE-003	Medium risk	\$1,200
PRE-004	High risk	\$1,500
PRE-005	Add optional coverage	Correct increase
PRE-006	Apply discount	Correct reduction
PRE-007	Risk + coverage + discount	Correct final premium
PRE-008	Minimum premium boundary	Correct minimum
PRE-009	Maximum premium boundary	Correct maximum
PRE-010	Invalid numeric values	Validation
PRE-011	Decimal values	Correct rounding
PRE-012	Tax calculation	Correct tax
PRE-013	Final payable amount	Correct total

Particularly important

Test:

Base premium + risk + coverage – discount + tax = final premium

This is a classic **P1 financial calculation**.

7. Policy issuance

TC ID	Scenario	Priority
POL-001	Issue policy from valid quote	P1
POL-002	Issue policy from expired quote	P1
POL-003	Issue policy with unpaid premium	P1
POL-004	Successful payment → policy issued	P1

TC ID	Scenario	Priority
POL-005	Failed payment → policy not issued	P1
POL-006	Policy number generated uniquely	P1
POL-007	Policy effective date correct	P1
POL-008	Policy expiry date correct	P1
POL-009	Policy document generated	P2
POL-010	Duplicate policy creation prevented	P1

8. Payment

Payment is another **critical-risk area**.

TC ID	Scenario	Priority
PAY-001	Valid card/payment	P1
PAY-002	Invalid card	P1
PAY-003	Expired card	P1
PAY-004	Insufficient funds	P1
PAY-005	Payment timeout	P1
PAY-006	Double-click payment button	P1
PAY-007	Duplicate transaction	P1
PAY-008	Successful payment	P1
PAY-009	Failed payment	P1
PAY-010	Payment receipt generated	P2

The **double payment** scenario is particularly important.

9. Policy modification

TC ID	Scenario	Priority
END-001	Modify address	P2
END-002	Change coverage	P1
END-003	Add driver	P1
END-004	Remove driver	P1
END-005	Modify vehicle	P1
END-006	Premium recalculated after modification	P1
END-007	Effective date validation	P1
END-008	Modification history maintained	P2

10. Renewal

TC ID	Scenario	Priority
REN-001	Eligible policy renewal	P1
REN-002	Expired policy renewal	P1
REN-003	Renewal premium calculated correctly	P1
REN-004	Renewal discount applied	P1
REN-005	Renewal with outstanding payment	P1
REN-006	Renewal notification generated	P2
REN-007	Renewal policy number generated	P1

11. Cancellation

TC ID	Scenario	Priority
CAN-001	Cancel active policy	P1
CAN-002	Cancel already cancelled policy	P1
CAN-003	Calculate refund	P1
CAN-004	Cancellation fee applied	P1
CAN-005	Cancellation effective date	P1
CAN-006	Cancellation confirmation	P2

12. Claims

Claims are another **P1 area**.

TC ID	Scenario	Priority
CLM-001	Submit valid claim	P1
CLM-002	Claim against valid policy	P1
CLM-003	Claim against expired policy	P1
CLM-004	Claim against cancelled policy	P1
CLM-005	Missing claim information	P1
CLM-006	Upload supporting documents	P2
CLM-007	Duplicate claim	P1
CLM-008	Claim amount exceeds coverage	P1
CLM-009	Claim approved	P1
CLM-010	Claim rejected	P1
CLM-011	Settlement amount calculated correctly	P1

TC ID	Scenario	Priority
CLM-012	Claim payment processed	P1

13. My recommended automation pyramid

For a **Playwright UI automation project**, don't try to automate everything through the UI.

I'd prioritize:

The **highest-value Playwright scenarios** would be:

E2E-001 — Generate insurance quote

```
Login
↓
Enter customer information
↓
Enter insurance information
↓
Select coverage
↓
Calculate quote
↓
Verify risk category
```

↓
Verify premium
↓
Verify quote number

E2E-002 — Purchase policy

Login
↓
Generate quote
↓
Accept quote
↓
Enter payment information
↓
Make payment
↓
Verify payment success
↓
Verify policy issued
↓
Verify policy number

E2E-003 — Payment failure

Generate quote
↓
Accept quote
↓
Enter invalid payment
↓
Payment fails
↓
Policy NOT issued
↓
Error displayed

E2E-004 — Policy modification

Login
↓
Search policy
↓
Modify coverage
↓
Recalculate premium
↓
Verify new premium

↓
Save endorsement

E2E-005 — Claim

```
Login
↓
Search policy
↓
Create claim
↓
Enter loss information
↓
Upload document
↓
Submit claim
↓
Verify claim number
↓
Verify claim status
```

14. Sample website for your Playwright training

For your particular learning goal, I would actually recommend **a purpose-built insurance sandbox rather than a real insurance website.**

We can create a small application containing:

Page 1 — Customer Registration

```
Customer Registration
-----
First Name
Last Name
Date of Birth
Email
Phone
Address

[Register]
```

Page 2 — Insurance Quote

```
Insurance Quote
-----
```

Insurance Type

- ☐ Auto
- ☐ Home
- ☐ Life

Age

Vehicle Value

Claims History

Location

Coverage

- ☐ Collision
- ☐ Comprehensive
- ☐ Roadside Assistance

Deductible

[Calculate Premium]

Page 3 — Quote Result

Quote Number: Q10001

Risk Category: HIGH

Base Premium:	\$1,000
Risk Surcharge:	\$500
Optional Coverage:	\$200
Discount:	\$50
Tax:	\$165

Final Premium: \$1,815

[Accept Quote]

Page 4 — Payment

Payment

Card Number

Expiry

CVV

Name on Card

Amount: \$1,815

[Pay Now]

Page 5 — Policy

Policy Issued

Policy Number: POL10001

Customer: John Smith

Coverage: Comprehensive

Premium: \$1,815

Status: ACTIVE

[Download Policy]

[Modify Policy]

[Cancel Policy]

Page 6 — Claims

Submit Claim

Policy Number

Date of Loss

Claim Type

Description

Claim Amount

Upload Documents

[Submit Claim]

This would give you an excellent **Playwright training application** because you can deliberately introduce:

- Positive/negative tests

Check Point Software

Ad

CTEM Solution by Check Point Exposure...

Most platforms talk about risk reduction in theory. We make it visible and measurable....

- Data-driven testing
- Risk-based testing
- End-to-end testing
- API/UI testing
- Page Object Model

- Fixtures
- Parameterization
- Screenshots
- Reports
- Trace Viewer

And, importantly, we can define the **business rules first**, so that your test cases have something objective to validate.

If you'd like, I can create the **complete** `insurance_sandbox.html` **website with all 6 pages/functions and realistic insurance calculation/validation rules**, specifically designed for you to automate using Playwright/TypeScript.
