

Yes. I re-checked the available sites specifically for **actual working insurance applications that are useful for automation**, rather than pages that merely say “Book a Demo.”

One caveat: **there are very few genuinely public Indian insurance test applications**. I don't want to give you three marketing/demo-request pages and call them automation demos.

My best 3

🏆 1. Tricentis Vehicle Insurance Demo — Best overall

Exact application URL:

[Open Tricentis Vehicle Insurance Demo](#)

Tricentis itself documents this as a **demo application for testing an insurance quoting website**.  Tricentis Docs +1

Available workflow:

```
graph TD
    Home --> Automobile
    Automobile --> EnterVehicleData[Enter Vehicle Data]
    EnterVehicleData --> EnterInsurantData[Enter Insurant Data]
    EnterInsurantData --> EnterProductData[Enter Product Data]
    EnterProductData --> SelectPriceOption[Select Price Option]
    SelectPriceOption --> SendQuote[Send Quote]
```

The application has multiple insurance types, including **Automobile, Motorcycle, Camper and Truck**, and the documented workflow includes vehicle, insurant and product information followed by insurance-package selection.  Tricentis D... +1

Excellent Playwright scenarios:

- Form filling
- Dropdowns
- Radio buttons
- Checkboxes
- Date pickers
- Required-field validation

- Numeric validation
- Multi-step forms
- Insurance package selection
- Dynamic price table
- Quote calculation
- Quote verification
- Negative testing
- Data-driven testing
- Page Object Model
- Fixtures
- Screenshots/traces
- Cross-browser testing

Automation rating: ★★★★★

Best for: Your main Playwright insurance project.

🏆 2. Micro Focus / OpenText Insurance Web Demo — Very good for Selenium/Playwright

Exact URL:

[Open Insurance Web Demo](#)

This is an older but **purpose-built insurance testing application**. OpenText's own testing material uses this application for automation exercises.  OpenText Com... +1

It includes functionality such as:

```
Login
↓
Insurance Web Application
↓
Auto Quote
↓
Agent Lookup
↓
Create Account
↓
Logout
```

OpenText's documented Selenium example specifically demonstrates:

- Login
- Email/password

- Logout
- Agent lookup
- ZIP-code search
- Selecting **Auto Quote** from a dropdown
- Searching for an insurance agent
- Validating returned results

 OpenText Com... +1

Good Playwright scenarios:

- Login/logout
- Authentication
- Dropdown handling
- Form validation
- Agent search
- Search results
- Assertions
- Wait strategies
- Page Object Model
- Reusable login fixture
- Negative login tests

Automation rating: ★★★★★

 **Important:** This is an old demo application. If your goal is modern Playwright training, use it as a secondary application, not your primary one.

3. Discovermarket Corporate Insurance Demo — Excellent insurance business workflow

This one is more interesting from a **real insurance-domain/business-process perspective**.

Exact UAT URL:

Discovermarket Corporate Insurance UAT

The published user manual identifies this as a **demo application** and provides the UAT URL.

 Discover Market

It starts with a **Risk Details** form for a corporate insurance purchase journey.

The workflow includes:

Risk Details

The application uses information about the organization's business activities to determine pricing/risk categories and can refer high-risk businesses or businesses outside standard coverage. [Discover Mar...](#)

Excellent for advanced automation scenarios:

- Complex forms
- Risk assessment
- Conditional logic
- Business rules
- Dropdowns
- Validation
- End-to-end insurance purchase
- Risk-based decision testing
- Boundary-value testing
- Data-driven testing
- Negative scenarios

Automation rating: ★★★★★

⚠ This is **corporate/cyber insurance**, rather than Indian motor insurance, and the UAT environment can change over time. The published documentation also warns that the demo is continuously updated. [Discover Mar...](#)

Which one should YOU use?

Considering your focus on **Playwright + TypeScript** and creating training/YouTube material, I'd rank them:

Rank	Application	Automation	Domain depth	Playwright suitability
🏆	Tricentis Vehicle Insurance	★★★★★	★★★★★	★★★★★

Rank	Application	Automation	Domain depth	Playwright suitability
	Discovermarket Corporate Insurance	★★★★★	★★★★★	★★★★★
	OpenText Insurance Web	★★★★★	★★★★	★★★★★

But if your requirement is specifically India

I would **not claim that any of these three is an Indian insurance application**. The publicly accessible Indian insurance platforms I found—such as Indian InsurTech products—mostly expose a **sales/demo-request process**, rather than a freely accessible QA environment.

For example, Indian insurance platforms advertise functionality such as digital policy issuance, claims, renewals, premium calculators and APIs, but require access/demo arrangements rather than exposing a public test application.

So for your training, I would do something slightly smarter:

Use Tricentis as the actual application, but create **Indian insurance test data and business scenarios** around it:

```
Customer: Indian customer
Vehicle: Maruti Suzuki Swift
Insurance: Comprehensive
Coverage: ₹7,50,000
NCB: 20%
Add-on: Zero Depreciation
State: Tamil Nadu
```

Then your project can genuinely be presented as:

Indian Motor Insurance Automation using Playwright + TypeScript

without pretending that the underlying demo is an Indian insurer.

★ **I recommend this as your project**

```
Insurance Automation Framework
|
├── tests/
│   └── automobile-quote.spec.ts
```

```
| └─ motorcycle-quote.spec.ts
| └─ camper-quote.spec.ts
| └─ truck-quote.spec.ts
| └─ negative-tests.spec.ts
| └─ data-driven-quote.spec.ts
|
| └─ pages/
|   └─ HomePage.ts
|   └─ VehicleDataPage.ts
|   └─ InsurantDataPage.ts
|   └─ ProductDataPage.ts
|   └─ PriceOptionPage.ts
|   └─ QuotePage.ts
|
| └─ test-data/
|   └─ insuranceData.json
|
| └─ fixtures/
|   └─ insurance.fixture.ts
|
| └─ playwright.config.ts
```

This would make a **very strong real-world Playwright portfolio project** because the Tricentis application has enough forms, business rules and a price table to demonstrate substantially more than simple locator automation.
